Lecture

Method Overriding

Override:

"To be more important than something"

Superclass

```
def welcome_students(self):
    # Body
```

```
def welcome_students(self):
    # Body
```

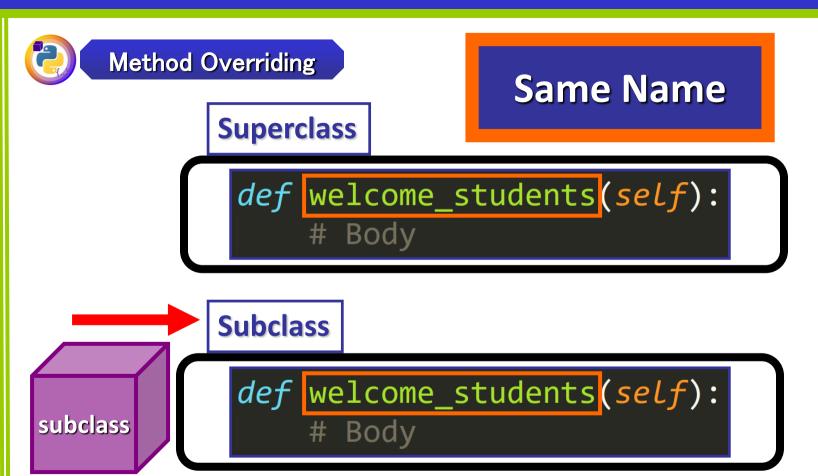

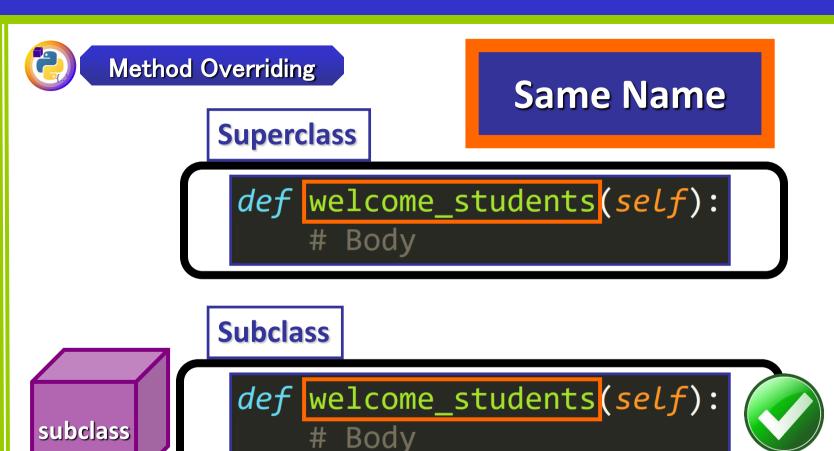

```
Superclass
 def welcome_students(self):
     # Body
Subclass
 def welcome_students(self):
     # Body
```

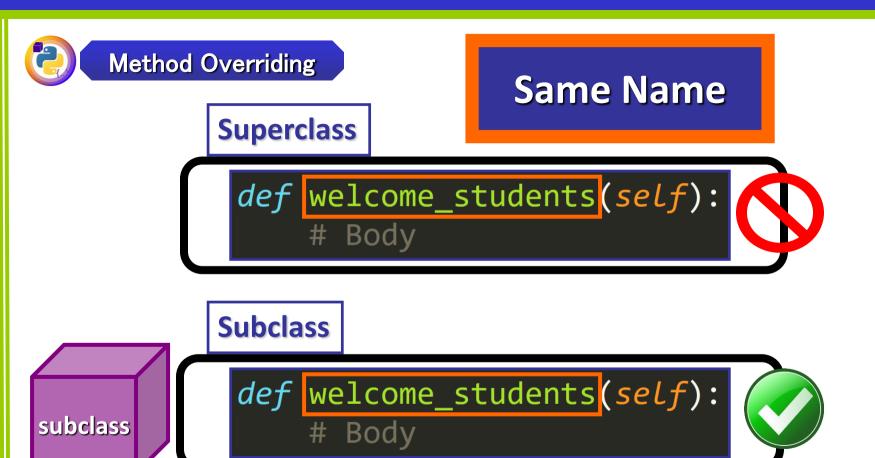

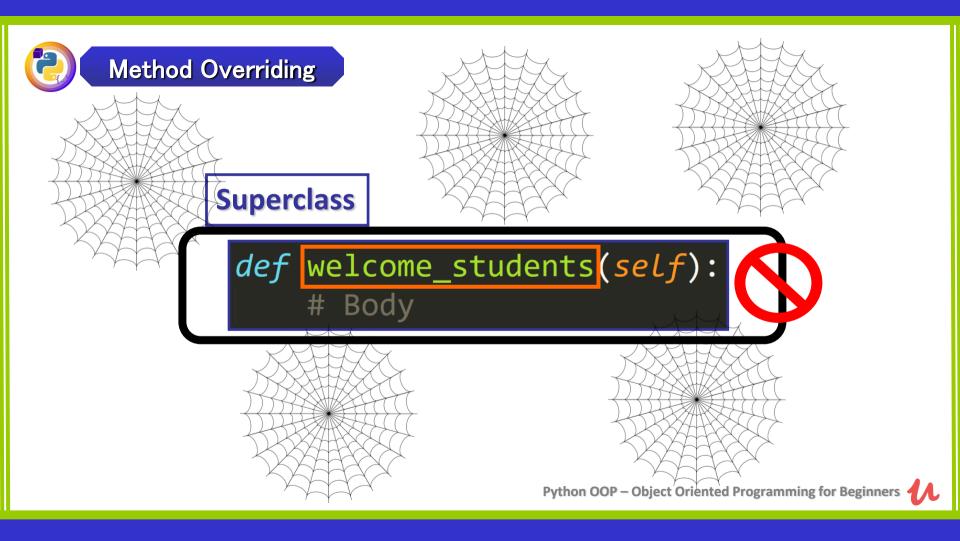

Same Name

Superclass

New Syntax

Superclass

```
def welcome_students(self):
    # Body
```

```
subclass
```

```
def welcome_students(self):
    # Code
    <superclass>.welcome_students(self)
```

New Syntax

Superclass

def welcome_students(self):
 # Body

Subclass

subclass

def welcome_students(self):

Code

<superclass>.welcome_students(self)

New Syntax

<superclass>.<method>(self, <args>)

New Syntax

Teacher.welcome_students(self, message)

Alternative Syntax

Superclass

```
def welcome_students(self):
    # Body
```

```
def welcome_students(self):
    # Code
    super().welcome_students()
```

Alternative Syntax

Superclass

```
def welcome_students(self):
    # Body
```

```
def welcome_students(self):
    # Code
super().welcome_students()
```

Alternative Syntax

super().welcome_students(message)

Alternative Syntax

super().welcome_students(message)

Purpose:

Expand or customize a method that is already defined in the superclass.

```
Superclass
                welcome_students(self):
                 # Body
terminology
           Subclass
                            Overrides
            def welcome_students(self):
                  Body
```

```
Superclass
                Overridden
 def welcome_students(self):
     # Body
Subclass
 def welcome_students(self):
      Body
```
